

Signal

Regain meaningful control over your attention

Rank by consequence. Deliver by context. Earn trust by showing your work.

Siray Li · Product Design · notifications for an org Admin Center

HOW I RAN IT

One master prompt, human at every gate

An MD master-prompt defined the process; **AI built between the gates, I decided at every one.** Every claim tagged *Brief* or *Assumption*; every decision logged.

PRODUCT REQUIREMENTS

CONTEXT

The frame

Organisation Admin Center Your steer
Adjacent to Xero; notification-rich, high-stakes.

BUSINESS GOAL Your steer

Growth & retention

Remind users of what matters at the right time → they build **trust** and **operate efficiently** → we keep customers and help them expand, growing the base.

USER GOALS

- Regain **meaningful control over attention** Brief
- Without setting every rule by hand Brief
- Know what needs me, act fast, trust nothing's missed Assumption

CRITICAL EVENTS YOUR STEER

The three that earn an interruption:

- 1 Access
- 2 Billing
-

TECH DIRECTION YOUR STEER

- Lean on **AI** capabilities
 - **Build on existing** products
 - **Multi-channel** delivery
- In-app SMS Slack Telegram WhatsApp

Three admins, one primary

Mara

Owner-admin · SME

PRIMARY

JOB TO BE DONE

"Tell me if something needs my decision — without me watching everything or configuring anything."

Wants to spend her time running the business and on strategy, not babysitting access, security & billing. Happy for the system to handle a lot — if it's explained clearly and easy to approve.

MENTAL MODEL

"A tripwire — only reach me when something's actually wrong."

NEEDS

- Interrupted only for true criticals
- One-tap, explained approvals
- Zero setup

Dev

Company / IT admin · SME

JOB TO BE DONE

"Tell me the shape of what's happening — who and what's affected, is it org-wide — so I can respond."

The technical admin for a small team; comfortable in the tools, protective of the org.

MENTAL MODEL

"A feed to triage; signals to monitor."

NEEDS

- Clear impact (who / what / org-wide)
- Ability to investigate
- Low false positives

Enterprise admin

Larger org · prioritised

JOB TO BE DONE

"Route the right signal to the right team and channel — proactively — through our existing tooling."

Has dedicated security/IT and existing integrations (SIEM, Slack, PagerDuty, ITSM) that already push proactive alerts.

MENTAL MODEL

"Part of our ops stack, not a new inbox."

NEEDS

- Plug into existing channels
- Governance & compliance
- Reduce noise across many admins

Time to act & resolve

Round-trip efficiency

Missed-critical rate

Mara's week

~90% of it is off the admin desk **Assumption**. Key moments, the pain at each, and the channel that fits.

CHANNEL RULE ● Critical → SMS/push anywhere ● Action → one well-timed push ● Routine → digest ● Triage → desk console

TAKEAWAY The critical moments happen while she's away from the desk — so the channel, not just the content, is the design.

Three problems, one system

1**Right thing, right moment, right channel** Brief

As a time-poor owner-admin, I want to be interrupted only for events that truly need me — on whatever device I'm on, so that I never miss a real Access / Billing / Security issue, and I'm never pulled away for noise.

HEART Task efficiency Happiness Retention

2**Understand & act — no expertise, no setup** Brief

As a non-expert admin, I want to the system to explain what happened and let me act in one tap — handling the routine itself, so that I stay in control without configuring or babysitting anything.

HEART Adoption Task efficiency Retention

3**Trust enough to let go** Assumption

As an admin handing work to AI, I want to see clearly what Signal did and why, so that I trust it and can step back.

Everything on the table

18 ideas · five scales · biased AI-native + multi-channel · each with its source

 A triage brain · now  B router · now  C copilot · later

How a notification travels

WHERE THE OPTIONS CAME FROM

Opt 1 · Hub feed

Gmail Priority Inbox · Google Workspace alert center
→ the trust / catch-up home

Competitor research

Opt 2 · Routed

PagerDuty · Opsgenie escalation policies
→ the spine (right moment/channel)

Industry ops pattern

Opt 3 · Digest-default

iOS Notification Summary · Focus
→ calm default for routine

Consumer-OS pattern

WHY WE RECOMMEND IT

Business goal

Fewer missed criticals + less fatigue → trust + efficiency → keep & expand.

User goals

① right moment = routing · ② no setup = digest-default · ③ trust = one feed + log.

Impact

High — the only flow that answers ① without breaking ②③.

Effort

Moderate — reuses existing channels & integrations (build-on-existing).

Scalability

High — routing + feed + log are the substrate the MCP copilot (C) plugs into.

The system (L1–L8) x the channels that deliver it

One notification atom, rendered per channel — buttons → quick-replies → reply-keywords → digest (board 39).

CHANNEL ↓ · MOMENT →	On-site · away 10:00 · a Critical fires	Between jobs 13:00 · action needed	Evening wind-down 20:30 · catch-up	Weekly desk window weekly · review & govern
Break-through push · SMS · Slack · WhatsApp	L1 · L2 Push + SMS (or Slack/WhatsApp) — "Admin login, new country" · Revoke / It's me	L1 One gentle push — "3 access requests"	— silent —	— silent —
Native app her calm catch-up	L2 Tap → rich card: why + impact + one-tap	L4 Needs you (1): Access backlog · swipe	L6 · L8 Overnight digest 0/6/7 · "Good morning" + Ask	— silent —
Desktop the deep workbench	— silent —	— silent —	— silent —	L4 · L2 · L3 · L5 · L7 · L8 Two-pane feed → detail → confirm → activity log → controls → copilot
Email / digest no live actions	— silent —	— silent —	L6 Email/Slack digest — sectioned, "nothing needed you"	— silent —
ITBD / DAIN	Reach me only for criticals; act without opening the app	Clear the decision fast; AI flags the odd one	Reassure me nothing's missed	Efficient triage + trust + light govern

The recommended stack, L1 → L8

L1	Push / SMS	Simple push → rich card on tap	Reach the ~90% away-moment; glance → deep → confirm without opening the app.	Board 19
L2	Card	Rich card	The reused atom: severity · impact · AI why · action, in one unit.	Board 31
L3	Confirmation	Inline morph + undo	Calm, in-place feedback + reversibility — the trust promise.	Board 32
L4	Hub feed	Responsive: two-pane (desktop) / single column (mobile)	Minimal disruption + efficiency on mobile; control + transparency on desktop.	Boards 15 · 16
L5	Activity log	Table + rich trail on tap	The trust surface — every AI decision visible, explained, reversible.	Board 17
L6	Digest	Stat-grid in-app + channel digest	Calm, batched summary on her 9am rhythm — in-app and email/Slack.	Board 33
L7	Controls	Smart defaults + light override	Meaningful control without configuration homework — answers the brief.	Board 34
L8	Copilot	Home + ask + timeline → chat	The agentic “ask anything” layer A + B ladder into (C · later).	Board 18

LIVE DEMO · 4 MINUTES

One system, in her hands

→ sirayli0137-bit.github.io/signal-attention-v2

1 · **The old way** ⇔ **Signal** — 16 equal rows vs 3 that need her

2 · **Act + undo** — revoke the escalation; reverse it

3 · **Activity log** — every AI decision, reversible

4 · **Controls** — Critical-only reshapes the feed live

5 · **Digest tab** — the week reviewed; apply the AI recommendation

6 · **Ask Signal** — “who has admin access?” → deep-link to the flagged item

7 · **Mobile** — 10:02 critical → 20:30 digest → “sleep well”

KEY DECISIONS & TRADE-OFFS

What I picked — and what it cost

A (triage brain) + B (router) now · C (copilot) later

cost · the boldest AI bet waits until trust is earned

Severity tiers over a ranked stream

cost · a moment to learn the three-tier model

Smart defaults over configuration

cost · AI must be right early, or trust breaks

Human-in-loop on all security

cost · Mara still does the final click on criticals — by design

Typed rules stand in for the model

cost · the “AI” is honest scaffolding; data is mocked; no real-user test yet

Cut: anomaly ML, enterprise governance, copilot — sequenced, not abandoned. [Boards 08 · 43](#)

USE OF AI TOOLS

WHERE IT ACCELERATED ME

- + Divergence: 18 ideas across 5 scales in one pass
- + The severity × impact taxonomy + edge cases
- + Mobbin sweeps: 26 cited patterns across L1–L8
- + Generated every board + the working prototype
- + Audited its own output (impeccable · a11y · critique → 17 findings)

WHERE MY JUDGEMENT OVERRODE IT

- It wanted to auto-resolve low-risk security → human-in-loop, locked
- It over-batched criticals into the digest → severity split
- It pushed chatbot-first → feed-first, copilot later
- Every  checkpoint decision was mine — the MD process made that structural

NEXT STEPS

1. Watch five real admins use it — validate tiers, “why” lines, trust in auto-handled
2. Live triage model behind the same typed-rules interface; measure accept rate
3. Ship the Slack/SMS round-trip; then instrument the HEART trust gate for real

Full list on Board 43 · audit trail on Boards 40–41.

TAKEAWAY Prioritised trust over capability at every fork; AI accelerated everything but decided nothing at the checkpoints; next step is real admins. not more polish.

If we had more time

01 Watch five real admins use it

One observed session beats three rounds of my own polish — validate the tiers, the “why” lines, and whether Mara actually trusts the auto-handled column.

02 Put a live triage model behind the rules

The severity × impact scoring is a typed table today; the same interface takes a real model. Measure its accept rate before widening scope.

03 Ship the Slack / SMS round-trip

Board 39 renders the channels; production needs webhook actions with idempotent undo — the hardest engineering in the concept.

04 Enterprise routing & governance

Multi-admin dedupe, team routing, audit exports — the prioritised enterprise archetype’s layer on the same engine.

05 Instrument the HEART dashboard

Wire the metrics board (02) for real: trust-gate score, % auto-handled (the “let-go” metric), time-to-critical. Trust must be measured, not assumed.

06 Pressure-test severity language

Localise and tone-test “Critical / needs you” copy — severity words carry different weight across markets and roles.

TAKEAWAY Not vague wishes — six concrete pieces of work, and the order matters: validate with real admins first, then earn the right to automate more.

**Rank by consequence.
Deliver by context. Earn
trust by showing your work.**

Prototype · sirayli0137-bit.github.io/signal-attention-v2

Process & evidence · MagicPath canvas (47 boards) · Q&A appendix follows

Siray Li — thank you

The brief's six questions

● Who is the user?	Mara — owner-admin of an Atlassian-style task-management Admin Center (Meridian Studio, 142 people). SME-IT and enterprise admins ride the same system.	Boards 01 · 03
● What notification problem?	One recency-sorted stream where Access · Billing · Security criticals look identical to routine FYIs — so admins miss the one that matters and learn to ignore the rest.	Boards 04 · 06
● How does the system decide what matters?	AI scores every event on severity × impact (typed rules today, a model behind the same interface later) → Needs you now · Handled for you · Worth knowing.	Boards 09 · 12
● Informed without being overwhelmed?	Severity × context routing : criticals break through anywhere; action items get one well-timed push; routine is auto-handled or batched into the 20:30 digest — and silence is visible.	Boards 36 · 39
● How do users remain in control?	Smart defaults + light override — control without configuration homework. Undo on everything, the activity log shows every AI decision, and Security is locked from auto-handling.	Boards 34 · 17 · 28
● What role does AI play?	It triages, explains (“why now”), recommends, and renders per channel — but never auto-acts on security or access. The agentic copilot (L8) is the layer it earns after trust.	Boards 07 · 18 · 29

TAKEAWAY One sentence each, every answer traceable to a board — the system decides by consequence, delivers by context, and earns

PROBLEM FRAMING

Who, where, and what exactly

THE USER

Mara, owner-admin — runs the business, not the admin center. ~90% of her week is away from the desk. [Boards 03 · 04](#)

THE CONTEXT

An **Atlassian-style Admin Center** for a task-management suite — chosen because admin notifications are high-stakes and genuinely noisy, without competing on Xero’s accounting turf. [Board 01](#)

THE SPECIFIC PROBLEM

One recency-sorted stream: a **privilege escalation, a failing payment, and a “user added”** all look the same — missed criticals on one side, alert fatigue on the other. [Boards 04 · 06](#)

DESIGN DIRECTION · THE PROTOTYPE WALK

Eight beats, live

- 1

Triage

Two-pane feed — 3 things need you, not 40. Filter by domain.
- 2

Decide

Severity · impact · the AI “why now” — the full story on one card.
- 3

Act + undo

One tap; the card morphs to confirmed; everything reversible.
- 4

Trust

The activity log — every AI decision visible, explained, undoable.
- 5

Govern

“What may interrupt me” — AI-set defaults; Critical-only live-reshapes the feed.
- 6

Away

Mobile break-through: push → data card → confirm, without opening the app.
- 7

Wind down

20:30 digest — “O need you”, the day batched (L6, mobile + desktop Next-Up).
- 8

Ask

Copilot answers from your org and deep-links back to the

3 R3 · "Later" is dead + targets under 44px P1
The push's "Later" button does nothing (should hold for the digest); Confirm ≈33px, push actions ≈30px tall — below the 44px touch minimum. — a11y 2.5.5 · Riley

8 R8 · No SMS / channel variant P2
Board 39 promises SMS · Slack · WhatsApp renderings; the flow only demos push. A push ≠ SMS segmented toggle would prove the channel story. — ref: board 39 · NordVPN · Atlassian+Slack

13 R13 · Success lacks a next beat P3
"Back to your day" is copy only — a subtle auto-return or digest peek would close the loop. — emotional journey · Casey persona

14 R14 · Static entity data P3
"142 members / card · 4291" aren't tappable; references deep-link entities. — ref: Granola · your Figma mobile

WHAT ALREADY WORKS

- ✓ Progressive depth (glance → data → confirm) matches your L1 reference exactly
- ✓ One Critical only breaks through — the calm story is legible in 3 taps
- ✓ Confirm state names the outcome + undo (Zip/Mindvalley pattern)

TAKEAWAY The mobile flow tells the right story — fix R3 (dead "Later" + 44px targets) before the demo; SMS variant (R8) is the highest-value addition from our own research.
